

3D laser profiling analysis makes it possible to measure real free face data and create 3D images to conduct a total free face evaluation. This can give immediate solutions to improve fragmentation and avoid safety and environmental problems.

## APPLICATIONS

✗	Open pit
✗	Civil construction
✗	Underground
✗	Quarry

## BENEFITS

3D laser profiling is the most accurate way to define blast geometry –free face and borehole position- that will help assure for the best blast performance results.

### Real measurement:

- ✗ Vertical height bench, to define borehole length and blast compatibility.
- ✗ First row position, real distance between the bench crest and hole.
- ✗ Bench angle, theoretical borehole definition.
- ✗ Toe, in order to define the subdrilling, bottom charge or density loading.
- ✗ Distances (Burden, Spacing)
- ✗ Real volume.

### Safety

- ✗ Burden colour codes.
- ✗ Fly rock control, adjusting explosive charge to the real burden along the bench height.
- ✗ Adequate explosive charge determination according to minimum/maximum burden.

### Blast optimization

- ✗ Blast profiling.
- ✗ Free face global evaluation.
- ✗ Borehole marking.

### Environment

- ✗ Noise reduction due to gas confinement
- ✗ Vibration control, by defining real toe and the adequate blast pattern to assure for breakage and displacement.

## EQUIPMENT

**Different 3D equipment brands and even technologies can be used. Quarryman Pro and Pulsar 3D are standard equipment in MAXAM.**

- ✗ Measure range with reflector up to 600 meters.
- ✗ Angular encoder accuracy: 0.02°
- ✗ Angular encoder resolution: 0.01°
- ✗ Accuracy: 5cm
- ✗ Automated scan rate: 250points/second
- ✗ Operating temperature -10°C to +45°C
- ✗ Water and dust resistance (IP63)

## METHODOLOGY

In order to get the best results, it is necessary to follow a step by step work procedure while doing 3D laser profiling.

- ✗ Definition of the area to be blasted.
- ✗ Location of reference points in the upper part of the blast.
- ✗ Selection of the scanning position, according to the size of the blast/free face.
- ✗ Scanning of the free face; special attention to singular areas that would require more accurate scanning.
- ✗ Drilling plan adaptation to the real free face.
- ✗ Mark the drilling pattern and adjust the 1st row.
- ✗ Measure actual drilling pattern using 3D laser.

As an addition to the data obtained in the quarry/ mine, it is possible to download the information to specific software such as MAXAM's -RIOBLAST allowing the analysis of borehole profiles in detail.
